Children 6 years of age and younger are routinely vaccinated against tetanus, diphtheria and pertussis. But older children, adolescents, and adults need protection from these diseases too. Td (Tetanus, Diphtheria) and Tdap (Tetanus, Diphtheria, Pertussis) vaccines provide that protection.

**TETANUS (Lockjaw)** causes painful muscle spasms, usually all over the body.
- It can lead to tightening of the jaw muscles so the victim cannot open his mouth or swallow. Tetanus kills about 1 out of 5 people who are infected.

**DIPHTHERIA** causes a thick covering in the back of the throat.
- It can lead to breathing problems, paralysis, heart failure, and even death.

**PERTUSSIS (Whooping Cough)** causes severe coughing spells, vomiting, and disturbed sleep.
- It can lead to weight loss, incontinence, rib fractures and passing out from violent coughing. Up to 2 in 100 adolescents and 5 in 100 adults with pertussis are hospitalized or have complications, including pneumonia.

These three diseases are all caused by bacteria. Diphtheria and pertussis are spread from person to person. Tetanus enters the body through cuts, scratches, or wounds.

The United States averaged more than 1,300 cases of tetanus and 175,000 cases of diphtheria each year before vaccines. Since vaccines have been available, tetanus cases have fallen by over 96% and diphtheria cases by over 99.9%.

Before 2005, only children younger than than 7 years of age could get pertussis vaccine. In 2004 there were more than 8,000 cases of pertussis in the U.S. among adolescents and more than 7,000 cases among adults.

**Td and Tdap vaccines**
- Td vaccine has been used for many years. It protects against tetanus and diphtheria.
- Tdap was licensed in 2005. It is the first vaccine for adolescents and adults that protects against all three diseases.

Note: At this time, Tdap is licensed for only one lifetime dose per person. Td is given every 10 years, and more often if needed.

These vaccines can be used in three ways: 1) as catch-up for people who did not get all their doses of DTaP or DTP when they were children, 2) as a booster dose every 10 years, and 3) for protection against tetanus infection after a wound.

**Routine: Adolescents 11 through 18**
- A dose of Tdap is recommended for adolescents who got DTaP or DTP as children and have not yet gotten a booster dose of Td. The preferred age is 11-12.
- Adolescents who have already gotten a booster dose of Td are encouraged to get a dose of Tdap as well, for protection against pertussis. Waiting at least 5 years between Td and Tdap is encouraged, but not required.
- Adolescents who did not get all their scheduled doses of DTaP or DTP as children should complete the series using a combination of Td and Tdap.

**Routine: Adults 19 and Older**
- All adults should get a booster dose of Td every 10 years. Adults under 65 who have never gotten Tdap should substitute it for the next booster dose.
- Adults under 65 who expect to have close contact with an infant younger than 12 months of age (including women who may become pregnant) should get a dose of Tdap. Waiting at least 2 years since the last dose of Td is suggested, but not required.
- Healthcare workers under 65 who have direct patient contact in hospitals or clinics should get a dose of Tdap. A 2-year interval since the last Td is suggested, but not required.
- New mothers who have never gotten Tdap should get a dose as soon as possible after delivery. If vaccination is needed during pregnancy, Td is usually preferred over Tdap.

**Protection After a Wound**
A person who gets a severe cut or burn might need a dose of Td or Tdap to prevent tetanus infection. Tdap may be used for people who have never had a dose. But Td should be used if Tdap is not available, or for:
- anybody who has already had a dose of Tdap,
- children 7 through 9 years of age, or
- adults 65 and older.

Tdap and Td may be given at the same time as other vaccines.

**Some people should not be vaccinated or should wait**
- Anyone who has had a life-threatening allergic reaction after a dose of DTP, DTaP, DT, or Td should not get Td or Tdap.
- Anyone who has a severe allergy to any component of a vaccine should not get that vaccine. Tell your provider if the person getting the vaccine has any severe allergies.
 Anyone who had a coma, or long or multiple seizures within 7 days after a dose of DTP or DTaP should not get Tdap, unless a cause other than the vaccine was found (these people can get Td).

 Talk to your provider if the person getting either vaccine:
 - has epilepsy or another nervous system problem,
 - had severe swelling or severe pain after a previous dose of DTP, D'TaP, DT, Td, or Tdap vaccine, or
 - has had Guillain Barré Syndrome (GBS).

 Anyone who has a moderate or severe illness on the day the shot is scheduled should usually wait until they recover before getting Tdap or Td vaccine. A person with a mild illness or low fever can usually be vaccinated.

5 What are the risks from Tdap and Td vaccines?

 With a vaccine (as with any medicine) there is always a small risk of a life-threatening allergic reaction or other serious problem.

 Getting tetanus, diphtheria or pertussis would be much more likely to lead to severe problems than getting either vaccine. Problems reported after Td and Tdap vaccines are listed below.

 **Mild Problems**
 (Noticeable, but did not interfere with activities)

 **Tdap**
 - Pain (about 3 in 4 adolescents and 2 in 3 adults)
 - Redness or swelling (about 1 in 5)
 - Mild fever of at least 100.4°F (up to about 1 in 25 adolescents and 1 in 100 adults)
 - Headache (about 4 in 10 adolescents and 3 in 10 adults)
 - Tiredness (about 1 in 3 adolescents and 1 in 4 adults)
 - Nausea, vomiting, diarrhea, stomach ache (up to 1 in 4 adolescents and 1 in 10 adults)
 - Chills, body aches, sore joints, rash, swollen glands (uncommon)

 **Td**
 - Pain (up to about 8 in 10)
 - Redness or swelling (up to about 1 in 3)
 - Mild fever (up to about 1 in 15)
 - Headache or tiredness (uncommon)

 **Moderate Problems**
 (Interfered with activities, but did not require medical attention)

 **Tdap**
 - Pain at the injection site (about 1 in 20 adolescents and 1 in 100 adults)
 - Redness or swelling (up to about 1 in 16 adolescents and 1 in 25 adults)
 - Fever over 102°F (about 1 in 100 adolescents and 1 in 250 adults)
 - Headache (1 in 300)
 - Nausea, vomiting, diarrhea, stomach ache (up to 3 in 100 adolescents and 1 in 100 adults)

 **Td**
 - Fever over 102°F (rare)

6 What if there is a severe reaction?

**Severe Problems**
(Unable to perform usual activities; required medical attention)

**Tdap**
- Two adults had nervous system problems after getting the vaccine during clinical trials. These may or may not have been caused by the vaccine. These problems went away on their own and did not cause any permanent harm.

**Td or Td**
- Swelling, severe pain, and redness in the arm where the shot was given (rare).

A severe allergic reaction could occur after any vaccine. They are estimated to occur less than once in a million doses.

7 The National Vaccine Injury Compensation Program

A federal program exists to help pay for the care of anyone who has a serious reaction to a vaccine.

For details about the National Vaccine Injury Compensation Program, call 1-800-338-2382 or visit their website at www.hrsa.gov/vaccinecompensation.

8 How can I learn more?

- Ask your provider. They can give you the vaccine package insert or suggest other sources of information.
- Call your local or state health department.
- Contact the Centers for Disease Control and Prevention (CDC):
  - Call 1-800-232-4636 (1-800-CDC-INFO) or
  - Visit CDC’s website at www.cdc.gov/vaccines.

DEPARTMENT OF HEALTH AND HUMAN SERVICES
CENTERS FOR DISEASE CONTROL AND PREVENTION
Southeastern Louisiana University Health Center
Tetanus, Diphtheria, and Pertussis (Tdap)
Consent Form

Education:
This vaccine prevents three serious diseases. Tetanus, Diphtheria, and Pertussis. They can cause permanent damage and death.

- **Tetanus** (lockjaw) causes painful tightening of the muscles. It can lead to “locking” of the jaw and inability to swallow. Approximately 30% of people (3,000 out of every 10,000) who get tetanus die from the disease and many more suffer permanent damage.

- **Diphtheria** causes a thick coating in the back of the throat which can cause breathing problems. Diphtheria can also lead to paralysis and heart failure. Approximately 5% of people (500 out of 10,000) who develop diphtheria die from the disease and many more suffer permanent damage.

- **Pertussis** (Whooping Cough) causes severe coughing spells, vomiting, and disturbed sleep. It can lead to weight loss, incontinence, rib fractures, passing out from violent coughing, pneumonia, and hospitalization due to complications.

For those people who receive the full series of Td vaccines, including a booster once every 10 years, nearly 100% are protected from tetanus and 95% are protected from diphtheria.

Reactions:
About half of people who receive the vaccine will have no side effects at all, and most other people will have only a mild local reaction.

- Mild reactions include soreness or redness where the shot was given.
  Aspirin-free pain reliever can be used to reduce fever and soreness.

- In rare cases (less than 1 out of 10,000), people can have a moderate reaction.
  This reaction consists of a painful swelling of the arm from the shoulder to elbow several hours after receiving the injection, fever >102, redness, swelling, nausea, vomiting or diarrhea

- In very rare cases (far less than 1 out of 10,000), people can have a serious allergic reaction.

  Signs of a serious reaction include having trouble breathing, getting hives, becoming pale or weak, having a very fast heart beat or feeling dizzy. If you notice any serious allergic reaction, notify the nurse immediately.

Contra-indications: hypersensitivity to any components of Tetanus, Diphtheria, or Pertussis vaccine or prior allergic reaction.

Td should be used rather than Tdap if Tdap is not available, and for anybody who has already gotten Tdap, adults 65 years of age and older, and children 7 through 9 years of age.

Questionnaire:

1. I am ill today □Yes □No
2. I am allergic to thimerosal □Yes □No
3. I am allergic to latex □Yes □No
4. I am pregnant □Yes □No
5. I have received a VIS □Yes □No

VIS Date: ________________

I have read the Tdap vaccine info sheet and choose to have the vaccine today. I have been allowed to ask any questions.
